The precast concrete segments shall also be designed for handling and erection stresses based on the method of construction or site conditions. Box culverts can be designed to any standard or custom size and strength, including capability for with standing any loads. Additional features can include toe walls, headwalls, wing walls, and water tight joints where required and shall be designed as per the provisions of IRC:SP:13. The precast concrete segmental box culvert shall be designed for CI 70 R loading and stresses induced while handling.

The dimensions of top slab, bottom slab and web shall be finalized on the basis of designs and project requirements. Contractor shall carry out the detailed design. It shall be proof checked by any IIT and submitted HQ CE (P) Dantak for approval along with calculation sheets.

4. CONSTRUCTION METHODOLOGY

4.1 **Only Dry cast method of casting of Precast Box Culvert under controlled factory set up environment are permitted which shall be checked by a BOO detailed by the Accepting Officer during technical evaluation stage of bids.** All testing facility shall be in built with the production unit. Notwithstanding, the precast unit may also be get checked by a third party/ NABL accredited Laboratory at the discretion of the Accepting Officer. The factory shall be owned by the bidder and the address of the factory set up alongwith connected documents should be submitted by the bidder alongwith bidding documents.

4.2 Dry Cast Method

In this method precast segments are cast using mechanized equipment. Form vibrators consolidate zero-slump concrete between core and jacket. Hole formers can be incorporated, or sometimes coring is resorted to as may be needed. The Precast Concrete segment is immediately stripped and the form is reused. Segments are typically cured in a curing tank, or moisture curing is used.

4.4 Curing methods

Steam curing or water curing or Membrane curing shall be adopted as per IRC:112.

4.5 Identification and Marking

All pre cast units shall bear an indelible identification, location and orientation marks as and where necessary. The date of manufacture shall also be marked on the segments. The identification markings on the drawings shall be shown in a table on the setting schedule together with the length, type, size of the unit and the sizes and arrangement of all reinforcement for easy identification of the segment.

4.6 Dimensions of the precast segmental box unit shall conform to the design requirements. The transportation/shifting of the pre-cast elements shall be carried out only after achievement of minimum strength of 20 MPa or 0.7 times the designed compressive strength of concrete. The strength of concrete shall be tested as per IS:516.

4.7 The delivery and off loading of precast concrete box culverts segments should be well planned. A suitable hard access that can be used safely by standard delivery vehicles and a suitable crane of adequate capacity shall be provided in the casting yard. The pre-cast concrete segments shall be properly cured to ensure achievement of appropriate strength.

4.8 **Handling**

Products shall be stored, handled shipped and unloaded in a manner to minimize damage. The handling process encompasses the demoulding of the precast units, their loading and transportation to storage areas, off loading and storage, transfer to site and site erection. To avoid excessive stresses and possible damage, all precast units should be handled in the manner as envisaged in their design by means of approved devices, identified in the production and erection drawings.

4.9 **Lifting Equipment, Accessories, Storage, Transportation and Installation**

Lifting holes or inserts shall be consistent with industry standards. Lifting shall be accomplished with methods or devices intended for this purpose Lifting equipment such as mobile crane, gantry crane, forklift etc. must be carefully selected to ensure that lifting of precast units is carried out within the rated capacity of the equipment. The support for the lifting equipment must be checked to ensure that adequate supporting capacity is provided. Lifting accessories may comprise combinations of lifting beams or frames, slings or cables, hooks or shackles. The selection of each of these components should be predetermined to take account of the forces exerted on them due to various aspects of the lifting operations. A person suitably qualified in accordance with the relevant regulations must regularly inspect all lifting equipment prior to and after use. Results of such inspections must be properly recorded and be available for subsequent inspection. The location of lifting points should be clearly indicated on the drawings. Lifting methods may differ from different manufacturers and the same shall be agreed upon. Verticality or otherwise of the lifting ropes shall be as per the design requirements. During operation of lifting and unloading the precast concrete box culvert segment shall be protected from damage particularly the joining surfaces. Also, due care shall be taken for safety of the crew during this operation.

4.9.1 **Factory/Casting Yard and Site Storage**

Storage areas must be large enough so that the precast units can be stored safely, with adequate room for lifting equipment and transporting vehicles to manoeuvre. The ground of the storage area must be hard, level, clean and well drained to permit organised storage. Precast segments can be damaged by incorrect stacking and storage. Where the locations of support points for a precast unit are critical, the locations for the supports should be noted on the shop drawings.

For Accepting Officer

Supports must be arranged to avoid twisting or distorting of the precast segments and must be adequate to transfer the weight of the stacked units to the ground without excessive settlement.

The stored and stacked units should be protected to prevent accidental damage and discolouration and the support material should be non-staining. Lifting points should also be well protected and kept accessible while the units are in storage. Precast segments must be stored safely with adequate supports such that it would not endanger any workers moving in the vicinity.

4.9.2 **Transportation**

Commonly precasting yards are at a distance from the project site where in these segments are to be used. Hence, it is necessary to transport them from casting yard to the construction site. Transportation requirements will need to be met and permits, where applicable, obtained. Transportation must comply with the appropriate regulations. The precast units should have gained sufficient strength before being loaded for transportation.

4.9.3 **Loading and Storage on Transporters**

Precast units must be loaded carefully on to delivery vehicles to prevent damage. To protect the edges throughout their journey, proper devices should be used to support, secure and wedge the precast units. The units should be adequately secured and supported to prevent them from overturning, shifting or being damaged during transportation. Adequate non staining cushioning should be provided between the unit and any securing chains, cables or ropes to prevent localized damage.

Precautions should also be taken to ensure that no undesirable stresses will be transmitted to the precast unit due to any flexing of truck or trailer.

5. **JOINT SEALING**

- 5.1 Many methods for jointing and sealing are available. The joints and sealing of units shall be as per the design or project requirements. The design of joints shall be made in the light of their assessment with respect to feasibility, practicability, serviceability considerations as per IS:15916:2010. The Contractor shall provide the Sealant can be either bituminous mastic sealant or extruded sealant.

6. **QUALITY MANAGEMENT**

6.1 **Quality Control**

It is necessary to have quality control system in place for all elements, material and ingredients used in fabrication. Reference may be made to "Guidelines on Quality Systems for Road Bridges", IRC:SP:47-1998. These specifications shall be in accordance with "Specifications for Road and Bridge Works" of Ministry of Road Transport and Highways published by the Indian Roads Congress.

6.2 **Factory**

For a mass scale production, the factory for the casting of units must ensure that the precast units are manufactured under a Quality Management System certified under ISO 9000 covering the following items:

- Quality control tests of materials;
- Calibration of laboratory equipment for quality control tests; and
- Product on process and control of equipment at the casting yard.

The factory and contractor shall be responsible for maintaining the quality of the manufacturing process for the precast units. The authorised person/registered structural engineer must satisfy himself that the precast concrete units have been constructed in accordance with the approved drawings and specifications. This may be achieved by providing full time construction supervision by their representative. If more stringent control on quality is considered necessary, the authorized person/structural engineer may step up the supervisory and testing requirements at appropriate place to test check the quality of the material and finished product.

Rigorous quality control procedures must be maintained at the precasting factory/casting yard at all times to ensure that the precast segments are constructed in accordance with the designs and specifications. Upon leaving the precasting factory/casting yard all precast segments or batch of segments must carry documentation certified by the factory/casting yard stating that the segments have been manufactured under a certified quality assurance scheme and in accordance with the prescribed specifications.

6.3 **Testing Standards**

6.3.1 **Concrete**

Sampling and testing of concrete should comply with the IS: 1159 and IS: 516 and as required by the contract documents. The testing is to be undertaken by equivalent approved accredited laboratory.

6.3.2 **Reinforcement**

Reinforcing steel shall be of HYSD steel as per Table 18.1 of IRC:112. For seismic zones III, IV and V, HYSD bars having minimum elongation of 14.5% and conforming to other requirements of IS:1786 shall be used.

According to IRC:112, the corrosion resistance of reinforcing steel can be improved by using (i) galvanised reinforcement with coating as per IS:12594-1988, (ii) Epoxy coated reinforcement conforming to IS:13620-1993 or by (iii) stainless steel reinforcement conforming to IS:6744:2001

Sampling and testing of reinforcement should comply with the IS code. All testing is to be undertaken by equivalent approved accredited laboratory and in accordance with IS code or contract specifications.

7. **STRUCTURAL INTEGRITY**

Although quality control checks are carried out for the precast units at the factory, there is a possibility of damage during handling and transportation. As the precast units are received on site they should be visually inspected for any signs of structural defect. Acceptance of any structural defect should be assessed with regard to the causes and the overall structural integrity of the precast units.
